FABULOUS COLLECTION OF BIO FIRES, CAVITY INSERTS AND COFFEE FIRE TABLES

Available now for the first time in the UK and exclusively from Urban Icon, is an inspirational and comprehensive range of bio fires, which can be used in practically any interior or indeed outdoor design project, whether it is contemporary interior accommodation or commercial projects such as receptions, spas, hotels or restaurants. There really is a fire for the occasion both indoor and outdoor.

This range of exciting and innovative bio ethanol fires is available exclusively from Urban Icon, has broken the restrictions of traditional fire designs and made fire an interior design construct. For the first time fire is combined with design and liberated into interior living and commercial spaces. The revolutionary fire concept uses Fanola® fuel which burns without smoke, odour or residue thereby removing the need for traditional chimney or flue venting and can be used in both indoor and outdoor environments.

Inspired by contemporary lifestyle, our range of flueless fires brings the element of fire from the past to present interior spaces. Our stunning, innovative and ecologically sound L Shape Fire was featured at this year's Grand Designs Live exhibition in the House of The Future at London's Excel. Showcasing the best and the most innovative products available for today's contemporary homes, the L Shape Fire is set to

inspire homes throughout the UK with its distinctive mix of clean design and green credentials. Opened by Grand Designs' Kevin McCloud, particular interest in new technology for the home has never been greater coupled with strong emphasis on sustainability and environmental benefits.

This range of unique bio fires from Planika, is now available for the first time in the UK from MSL Interiors and marketed through Urban Icon. The bio fires use an environmentally friendly fuel called FANOLA® bio ethanol, which is manufactured from sustainable and renewable plant sources. When burning, FANOLA® produces no smoke or smell and leaves no residue. In addition to mesmeric dancing flames, the only combustion products other than heat, are carbon dioxide and water vapour, which are given off in similar proportions to exhaled human breath. Consequently no chimney or flue ventilation is required, so these bio fires can be placed virtually anywhere in the home or in profiled commercial interiors, assuming normal ventilation. For the first time fire can be used as a design construct and can be liberated into interior spaces both in the home, out on the patio and in commercial settings such as bars, restaurants, hotels and spas.

This comprehensive portfolio of bio fires includes indoor and outdoor ranges from leading product designers Arik Levy, Christophe Pillet and Serge Atallah. With wall cavity or chimney inserts available in the Architects line and fully automated units in the Digifire® range, a whole new depth of creative texture can be brought to enhance even the most sophisticated of interior spaces.

For more information regarding the products and images please contact MSL Interiors directly on 08455 20 11 00 and ask for Mike or Jono or email as above.
